MOUVEMENT DE LA LUNE,

PAR M. DELAUNAY.

DEUXIÈME VOLUME.

PRÉFACE.

Contrairement à mes prévisions, ma *Théorie du Mouvement de la Lune* formera trois volumes au lieu de deux.

J'ai expliqué dans la Préface du premier volume en quoi consiste la question principale que je me suis proposé de résoudre, et qui constitue la partie fondamentale de mon travail. J'ai voulu déterminer, sous forme analytique, toutes les inégalités du mouvement de la Lune autour de la Terre, jusqu'aux quantités du septième ordre inclusivement, en regardant ces deux corps comme de simples points matériels, et tenant compte uniquement de l'action perturbatrice du Soleil, dont le mouvement apparent autour de la Terre est supposé se faire suivant les lois du mouvement elliptique. La méthode que j'ai employée pour atteindre ce but est exposée dans le chapitre III du premier volume. Les chapitres IV et V, qui terminent ce même volume, contiennent : 1° le développement complet de la fonction perturbatrice avec les modifications qu'elle a subies successivement par suite des 57 opérations effectuées pour la débarrasser de ses termes les plus importants; 2° le détail de l'établissement des formules de transformation relatives à ces 57 opérations. Pour compléter ce qui se rapporte à la solution de la question principale rappelée ci-dessus, il restait à donner : 1° le détail des opérations complémentaires destinées à tenir compte des termes que contient encore la fonction perturbatrice, après que les 57 opérations précédentes ont été effectuées; 2° le détail de toutes les parties que les formules fournies par les diverses opérations dont il vient d'être question introduisent successivement dans les expressions des trois coordonnées de la Lune, en allant jusqu'aux quantités du septième ordre pour la longitude et la latitude, et jusqu'à celles du cinquième ordre pour la valeur inverse du rayon vecteur : c'est ce qui forme la matière des chapitres VI, VII, VIII et IX de ce deuxième volume.

La réduction en nombres des diverses parties des expressions ainsi obtenues pour les trois coordonnées de la Lune montre que, si le degré d'approximation auquel on s'est arrêté est suffisant pour la latitude et la valeur inverse du rayon vecteur, il n'en est pas de même pour la longitude. J'ai donc dû faire des recherches supplémentaires destinées à pousser le calcul de certaines inégalités de la longitude jusqu'aux quantités du huitième et même du neuvième ordre. Le chapitre X contient le détail de ces recherches supplémentaires.

Enfin, dans le chapitre XI, on trouve le résumé des résultats obtenus précédemment, et donnés en détail dans les chapitres VII, VIII, IX et X: ce chapitre renferme les expressions analytiques finales des trois coordonnées de la Lune, expressions qui constituent la solution de la question principale rappelée ci-dessus, avec les suppléments d'approximation qui ont été jugés nécessaires pour diverses inégalités de la longitude.

Le troisième volume contiendra l'étude de toutes les circonstances accessoires qui ont été provisoirement laissées de côté pour pouvoir concentrer tous les efforts vers la solution de la question principale, objet des deux premiers volumes. On y trouvera le calcul des effets dus aux inégalités du mouvement

apparent du Soleil, ce qui comprend l'équation séculaire de la Lune; la détermination des inégalités lunaires dues à l'action des planètes; la recherche de l'influence que la figure de la Terre et le phénomène des marées exercent sur le mouvement de la Lune, etc. *

Paris, le 5 Janvier 1867.

^{*} Ce troisième volume doit également faire partie de la collection des Mémoires de l'Académie des Sciences; mais il ne suivra pas immédiatement les deux premiers, dans la série des tomes de ces Mémoires.

CHAPITRE VI.

OPÉRATIONS COMPLÉMENTAIRES DESTINÉES A TENIR COMPTE DE TOUS LES TERMES QUI RESTENT DANS LA FONCTION PERTURBATRICE, APRÈS LES 57 OPÉRATIONS DONT LE DÉTAIL EST DONNÉ DANS LE CHAPITRE V.

Après qu'on a effectué les 57 opérations dont le détail a été donné dans le chapitre précédent, la fonction perturbatrice R se trouve débarrassée d'un certain nombre de ses termes périodiques, et les autres termes se sont successivement modifiés, comme on le voit au chapitre IV. Faisons les réductions des termes semblables, dans les coefficients des divers cosinus, en laissant de côté les parties de ces coefficients qui sont indiquées comme ayant disparu, et aussi les parties du neuvième ordre dont nous avons eu momentanément besoin dans les termes (9), (25), (46), (58), (60), (68), (122), (138), (175), (179), (184), (192), (310), (313), (322), (340), (347), (359), (365), (373), (383), (407), (423) et (429). Nous trouverons ainsi que la nouvelle valeur de cette fonction R est la suivante:

Si nous nous reportons à ce qui a été dit au n° 54 (chapitre III), nous verrons que, pour achever la détermination des inégalités de la Lune, il ne nous reste plus qu'à introduire la valeur totale de R, qui vient d'ètre écrite, dans les six équations différentielles (9) du chapitre I, et à intégrer ensuite ces équations différentielles, ce qui ne présentera plus aucune difficulté. Mais, au lieu d'opérer ainsi en une seule fois, nous fractionnerons le travail en prenant successivement et un à un les divers termes périodiques qui entrent dans R; de cette manière, nous faciliterons les calculs sans en augmenter la longueur. En d'autres termes, nous continuerons à appliquer la méthode exposée dans le chapitre III, en effectuant une nouvelle série d'opérations destinées à faire disparaître successivement tous les termes périodiques qui restent dans la fonction R, afin de réduire cette fonction à son terme non périodique seul.

L'établissement des formules de transformation auxquelles chacune de ces nouvelles opérations doit conduire se fera naturellement avec beaucoup plus de simplicité que quand il s'agissait des 57 opérations développées dans le chapitre V, puisqu'on n'aura pas besoin de tenir compte du carré de la force perturbatrice partielle correspondant à chacun des termes périodiques de R que l'on considérera successivement. Aussi nous contenterons-nous de donner ces formules de transformation sans entrer dans aucun détail sur leur établissement. Nous dirons seulement ici d'une manière générale que, en vertu des valeurs des quantités L, G, H en a, e, γ (voir chapitre V, page 877), si nous supposons que R se réduise à son terme non périodique (1) et à un seul terme périodique $A \cos \theta$, l'argument θ ayant pour valeur $il + i'g + i''h + \alpha$, les équations différentielles que nous devrons considérer seront

$$\begin{split} \frac{da}{dt} &= -\frac{2}{an}i\mathbf{A}\sin\theta, \\ \frac{de}{dt} &= \frac{1}{a^2ne}\left\{(i'-i)\mathbf{A}\left(1 - \frac{1}{2}e^2 + \frac{225}{32}\frac{n'^2}{n^2}\right) + i\mathbf{A}\left(\frac{1}{2}e^2 - \frac{1}{8}e^4 - \frac{675}{32}e^2\frac{n'^2}{n^2}\right)\right\}\sin\theta, \\ \frac{d\gamma}{dt} &= \frac{1}{a^2n\gamma}\left\{(i''-i')\frac{\mathbf{A}}{4}\left(1 + \frac{1}{2}e^2 + \frac{9}{32}\frac{n'^2}{n^2}\right) + \frac{1}{2}\gamma^2(i'-i)\mathbf{A} + i\mathbf{A}\left(\frac{1}{2}\gamma^2 + \frac{1}{4}\gamma^2e^2 - \frac{27}{32}\gamma^2\frac{n'^2}{n^2}\right)\right\}\sin\theta, \\ \frac{dl}{dt} &= n\left\{1 - \left(\frac{7}{4} - \frac{21}{2}\gamma^2 + \frac{3}{4}e^2 + \frac{21}{8}e^{i2}\right)\frac{n'^2}{n^2} - \frac{225}{32}\frac{n'^3}{n^3} - \frac{3265}{128}\frac{n'^4}{n^4}\right\} \\ &- \left\{\frac{2}{an}\frac{d\mathbf{A}}{da} + \frac{1}{a^2ne}\frac{d\mathbf{A}}{de}\left(1 - e^2 + \frac{225}{32}\frac{n'^2}{n^2}\right)\right\}\cos\theta, \\ \frac{d(h+g+l)}{dt} &= n\left\{1 - \left(1 - \frac{9}{2}\gamma^2 + \frac{9}{8}e^2 + \frac{3}{2}e^{i2}\right)\frac{n'^2}{n^2} - \left(\frac{27}{8}\gamma^2 + \frac{675}{32}e^2\right)\frac{n'^3}{n^3} + \frac{451}{64}\frac{n'^4}{n^4} + \frac{787}{32}\frac{n'^5}{n^5}\right\} \\ &- \left\{\frac{2}{an}\frac{d\mathbf{A}}{da} - \frac{e}{2a^2n}\frac{d\mathbf{A}}{de} - \frac{\gamma}{2a^2n}\frac{d\mathbf{A}}{d\gamma}\right\}\cos\theta, \\ \frac{dh}{dt} &= -n\left\{\left(\frac{3}{4} - \frac{3}{2}\gamma^2 + \frac{3}{2}e^2 + \frac{9}{8}e^{i2}\right)\frac{n'^2}{n^2} - \frac{9}{32}\frac{n'^3}{n^3} - \frac{177}{128}\frac{n'^4}{n^4}\right\} \\ &+ \frac{1}{4a^2n^2}\frac{d\mathbf{A}}{de}\left(1 + \frac{1}{2}e^2 + \frac{9}{2n}\frac{n'^2}{n^2}\right)\cos\theta. \end{split}$$

On n'a conservé dans ces équations différentielles que les termes qui peuvent être utiles pour le calcul des inégalités fournies par les diverses parties restant dans la fonction R, en s'en tenant au degré d'approximation adopté. Pour cela, on s'est appuyé sur ce que A est au moins du sixième ordre, lorsque i, i', i'' ne

sont pas égaux tous trois. Dans le cas où i, i', i'' sont égaux, A est quelquefois du quatrième ordre seulement.

On intégrera ces équations différentielles en s'en tenant aux quantités du premier ordre par rapport à A, et l'on en conclura sans peine les formules de transformation destinées à faire disparaître de la fonction R le terme périodique $A\cos\theta$.

Les valeurs de L, G, H en a, e, γ , et la valeur du terme non périodique de R, ne seront généralement pas modifiées par suite des nouvelles opérations auxquelles nous allons procéder. Cependant s'il arrive exceptionnellement que quelques-unes de ces opérations introduisent des parties nouvelles dans ces quatre quantités, nous aurons soin de le signaler à mesure que ces circonstances se présenteront. Dans tous les cas, il n'en résultera aucun changement pour les équations différentielles à employer ultérieurement : ces équations différentielles resteront jusqu'à la fin comprises dans les formes générales que nous venons d'indiquer.

Les diverses opérations dont le détail vient d'être donné ont pour objet de faire disparaître successivement les différents termes périodiques qui existent dans la valeur de R placée au commencement de ce chapitre. Conformément à ce qui est expliqué dans le chapitre III, chaque fois que nous avons obtenu les formules de transformation fournies par une opération quelconque, nous devons en faire la substitution dans les valeurs de la fonction R et des trois coordonnées de la Lune, telles qu'elles résultent des opérations déjà effectuées antérieurement. Cette substitution des formules de transformation fournies par chacune des opérations 58 à 492, dans la valeur à laquelle la fonction R se trouve réduite par suite des opérations précédentes, ne donnera généralement pas de nouveaux termes périodiques dont nous ayons à tenir compte en raison du degré d'approximation auquel nous nous arrêtons. Cependant il se présentera quelques exceptions relativement aux termes périodiques qui pourront être obtenus de cette manière, et dont les arguments ne contiendront ni l ni l': le calcul des coefficients des termes de cette espèce devant être poussé jusqu'aux

quantités du dixième ordre, nous aurons à tenir compte de certains résultats de substitution qui, sans cette considération, devraient être laissés de côté comme tous les autres. Comme nos opérations complémentaires 58 à 492 sont disposées de manière à faire disparaître successivement les divers termes périodiques de R dans l'ordre où ces termes ont été écrits dans la valeur de cette fonction, nous ne devons pas oublier que, quand nous en sommes à une opération quelconque, tous les termes périodiques de R placés avant celui auquel correspond cette opération ont disparu par les calculs effectués précédemment : c'est donc seulement dans les termes placés à la suite de ce terme spécial qu'il y a lieu de substituer les formules de transformation, pour voir s'il n'en résultera pas quelque terme périodique de la nature de ceux dont nous venons de parler. En opérant ainsi, on trouve que les formules fournies par les 435 opérations complémentaires qui précèdent donnent naissance aux cinq nouveaux termes périodiques suivants dans la valeur de R :

Ces dernières modifications, introduites dans les valeurs de L, G, H par quelques-unes des opérations complémentaires de 58 à 497, n'ont pas d'influence sur les valeurs des dérivées $\frac{da}{dL}$, $\frac{da}{dG}$, $\frac{da}{dH}$, $\frac{de}{dL}$, \cdots calculées avec le degré d'approximation auquel nous nous sommes toujours arrêtés pour ces quantités. Les valeurs de $\frac{da}{dL}$, $\frac{da}{dG}$, $\frac{da}{dH}$, $\frac{de}{dC}$, $\frac{de}{dG}$, $\frac{de}{dH}$ resteront donc les mêmes que celles qui ont été données à la suite de la 52° opération (chapitre V, pages 834 et 835), et les valeurs de $\frac{d\gamma}{dL}$, $\frac{d\gamma}{dG}$, $\frac{d\gamma}{dH}$ seront aussi les mêmes que celles qui ont été données à la suite de la 54° opération (chapitre V, pages 857 et 858).

Pour achever l'intégration des équations différentielles que nous avions à intégrer, équations différentielles qui, après toutes les opérations effectuées précédemment, n'ont pas cessé de conserver la même forme, il ne nous reste plus qu'à y introduire pour R la valeur finale à laquelle nous venons d'être conduits (page 234). Cette valeur de R ne contenant plus de termes pério-

diques, et étant, par conséquent, indépendante de $l,\ g,\ h,\ {\rm nous}\ {\rm aurons}$ d'abord

$$\frac{d\mathbf{L}}{dt} = \mathbf{o}, \quad \frac{d\mathbf{G}}{dt} = \mathbf{o}, \quad \frac{d\mathbf{H}}{dt} = \mathbf{o};$$

L, G et H sont donc constants, et, par suite, il en est de même de a, e, γ . Quant aux valeurs de l, g, h, elles seront fournies par les équations différentielles

Les quantités a, e, γ étant constantes, ces valeurs de $\frac{dl}{dt}, \frac{dg}{dt}, \frac{dh}{dt}$ le sont également; il suffit donc de les multiplier par t, puis d'ajouter une constante arbitraire à chacun des trois produits, pour avoir les valeurs de l, g, h.

CHAPITRE VII.

VALEUR DE LA LONGITUDE DE LA LUNE, AVEC LES DIVERSES MODIFICATIONS QU'ELLE A SUBIES SUCCESSIVEMENT PAR SUITE DES 497 OPÉRATIONS DÉVELOPPÉES DANS LES CHAPITRES V ET VI.

Si nous nous reportons à notre point de départ, nous verrons que nous avions, pour les trois coordonnées de la Lune (la longitude V, la latitude U et la valeur inverse du rayon vecteur $\frac{1}{r}$), les valeurs elliptiques fournies par les formules (17), (18) et (16) du chapitre II, et que les quantités a, e, γ, l, g, h qui y entrent devaient être déterminées par l'intégration des équations différentielles (9), où R désigne la fonction développée dans le même chapitre II (pages 33 à 54). Par les diverses opérations dont le détail est donné dans les chapitres V et VI, nous avons été conduits à autant de systèmes de formules de transformation, qui, étant substituées successivement dans les expressions de R, V, U, $\frac{1}{r}$, ont pour effet de faire disparaître les uns après les autres les divers termes périodiques de R, et d'introduire en même temps des termes périodiques (ou inégalités) correspondants dans les valeurs de V, U, $\frac{1}{r}$, jusqu'à ce que, R se trouvant réduit à une quantité non périodique contenant seulement a, e, γ , l'intégration des équations (9) fournisse, sans la moindre difficulté, les valeurs finales de a, e, γ, l, g, h , valeurs dont les trois premières sont des constantes et les trois dernières sont des expressions variant proportionnellement au temps (fin du chapitre VI). Par là nous avons résolu complétement la question que nous nous étions proposé de résoudre, et qui avait pour objet la détermination des expressions des trois coordonnées de la Lune, en tenant compte de l'action perturbatrice du Soleil, sauf les restrictions indiquées au chapitre II (page 20).

Nous avons donné dans le chapitre IV l'expression complète de la fonction

perturbatrice R, avec tout le détail des modifications que cette fonction a subies par l'emploi des formules de transformation fournies par les 57 opérations principales développées dans le chapitre V. Chacune des 440 opérations ultérieures indiquées dans le chapitre VI n'a eu généralement d'autre influence sur la valeur de R que de faire disparaître un des termes périodiques restants, sans modifier en rien les autres termes de cette fonction; les quelques exceptions qui se sont présentées sont indiquées à la fin de ce chapitre VI. Il nous reste maintenant à faire connaître les valeurs complètes des trois coordonnées V, \mathbb{U} , $\frac{1}{r}$ de la Lune, avec toutes les modifications que nos 497 opérations y ont

introduites successivement : c'est ce que nous allons faire en donnant d'abord dans ce chapitre la valeur de la longitude V.

Pour bien comprendre la disposition adoptée dans l'écriture de cette longue formule, il faut se reporter aux explications données au commencement du chapitre IV sur la disposition analogue de la valeur de R. La manière dont les divers termes périodiques sont classés à la suite les uns des autres, la signification des nombres en petits caractères placés au-dessous des diverses parties des coefficients de ces termes périodiques, la portion de chacun de ces coefficients que l'on doit prendre quand on veut y substituer les formules de transformation fournies par une opération quelconque, tout cela est exactement pareil dans l'expression de R donnée au chapitre IV et dans l'expression de V que nous allons donner : tout ce qui a été dit pour l'une de ces expressions s'applique directement à l'autre.

Les calculs ont été faits de manière à obtenir, dans l'expression de la longitude V, tous les termes périodiques ou inégalités dont l'ordre analytique n'est pas supérieur à 7 (voir le n° 14, chapitre II), et dans le coefficient de chacun de ces termes périodiques, toutes les parties qui le composent, sans exception, jusqu'aux quantités du septième ordre inclusivement. Pour pouvoir effectuer les calculs ainsi, il nous a suffi de conserver les quantités du sixième ordre dans l'expression primitive de la longitude V, c'est-à-dire dans la valeur fournie par la formule (17) du chapitre II. Mais comme il arrive que, parmi les inégalités fournies par l'action perturbatrice du Soleil, il y en a qui ont exactement la même forme analytique que certains termes du septième ordre donnés directement par les formules du mouvement elliptique, sauf la valeur du coefficient numerique qui les affecte, nous avons dù, pour arriver à la valeur exacte des

termes de cette forme dans le résultat final, compléter sous ce rapport certaines parties de la formule (17) en y ajoutant les termes elliptiques du septième ordre dont il s'agit; c'est ce qu'on verra dans les termes périodiques (44), (54), (58), (68), (72), (78), (82), (86) et (88) de l'expression suivante :

CHAPITRE VIII.

VALEUR DE LA LATITUDE DE LA LUNE, AVEC LES DIVERSES MODIFICATIONS QU'ELLE À SUBIES SUCCESSIVEMENT PAR SUTTE DES 497 OPÉRATIONS DÉVELOPPES DANS LES CHAPITRES V ET VI.

Nous allons donner dans ce chapitre la valeur complète de la latitude U de la Lune, avec tout le détail des modifications que les 497 opérations des chapitres V et VI y ont introduites successivement.

La disposition adoptée dans l'écriture de cette valeur de la latitude est entièrement pareille à celles de la fonction perturbatrice R (chapitre IV) et de la longitude V (chapitre VII).

Pour la latitude, comme pour la longitude, les calculs ont été faits de manière à obtenir tous les termes périodiques ou inégalités dont l'ordre analytique n'est pas supérieur à 7 (voir le n° 14, chapitre II); et dans le coefficient de chacun de ces termes périodiques, toutes les parties qui le composent, sans exception, jusqu'aux quantités du septième ordre inclusivement. Pour pouvoir effectuer les calculs ainsi, il nous a suffi de conserver les quantités du sixieme ordre dans l'expression primitive de la latitude U, c'est-à-dire dans la formule (18) du chapitre II. Mais, de même que pour la longitude, quelques inégalités fournies par l'action perturbatrice du Soleil ont exactement la même forme analytique que certains termes du septième ordre donnés directement par les formules du mouvement elliptique; nous avons donc dû, pour arriver à la valeur exacte des termes de cette forme dans le résultat final, compléter sous ce rapport certaines parties de la formule (18) en y ajoutant les termes elliptiques du septième ordre dont il s'agit; c'est ce qu'on verra dans les termes périodiques (1), (17), (38), (48), (52), (53), (63), (72), (76), (77) et (82) de l'expression suivante :

CHAPITRE IX.

VALEUR DE LA PARALLAXE DE LA LUNE, AVEC LES DIVERSES MODIFICATIONS QU'ELLE A SUBIES SUCCESSIVEMENT PAR SUITE DES 497 OPÉRATIONS DÉVELOPPÉES DANS LES CHAPITRES V ET VI.

Nous donnons dans ce chapitre la valeur complète de la parallaxe de la Lune, ou plutôt de la quantité $\frac{1}{r}$ (inverse du rayon vecteur de la Lune), qui n'a besoin que d'être multipliée par le rayon de la Terre pour fournir cette parallaxe. On y trouvera le détail des modifications que les 497 opérations des chapitres V et VI y ont introduites successivement.

La disposition adoptée dans l'écriture de cette valeur de $\frac{1}{r}$ est entièrement pareille à celles de la fonction perturbatrice R (chapitre IV), de la longitude V (chapitre VII) et de la latitude U (chapitre VIII).

Tous les termes de cette expression, après qu'on l'a multipliée par le rayon de la Terre pour avoir la parallaxe de la Lune, contiennent en facteur le rapport de ce rayon terrestre à la distance moyenne de la Lune à la Terre, rapport qui est à peu près égal à $\frac{1}{60}$; il en résulte que, dans la recherche des coefficients des diverses inégalités de $\frac{1}{r}$, il n'est pas nécessaire de pousser l'approximation aussi loin que pour la longitude et la latitude. Les calculs ont été faits de manière à obtenir tous les termes périodiques dont l'ordre analytique n'est pas supérieur à 5 (voir le n° 14, chapitre II), et dans le coefficient de chacun de ces termes périodiques, toutes les parties qui le composent, sans exception, jusqu'aux quantités du cinquième ordre inclusivement.

$$\frac{1}{r} =$$

CHAPITRE X.

RECHERCHES SUPPLÉMENTAIRES SUR LA LONGITUDE DE LA LUNE.

En effectuant la réduction des parties semblables dans les coefficients des diverses inégalités de la longitude, de la latitude et de la parallaxe de la Lune, telles qu'elles sont données en détail dans les trois chapitres précédents, puis y remplaçant les lettres $a, e, \gamma, a', e', n, n'$ par leurs valeurs numériques (voir le chapitre XI), on reconnaît que le degré d'approximation auquel nous nous sommes arrêtés dans la détermination analytique de ces inégalités est en général amplement suffisant. Cependant il y a quelques inégalités de la longitude pour lesquelles il n'en est pas ainsi; les valeurs numériques des parties du septième ordre qui entrent dans les expressions de leurs coefficients sont encore assez grandes pour faire présumer que les parties des ordres immédiatement supérieurs qui n'ont pas été déterminées ne sont pas tout à fait négligeables. Il est donc nécessaire de compléter sous ce rapport les recherches précédentes et de reprendre le calcul de quelques inégalités de la longitude, en poussant l'approximation plus loin dans la détermination de leurs coefficients. Ce sont ces recherches supplémentaires qui font l'objet du présent chapitre.

Les coefficients des diverses inégalités de la longitude de la Lune sont des fonctions des petites quantités e, γ , e', $\frac{n'}{n}$, $\frac{a}{a'}$. Nous avons déterminé ces fonctions sous forme de séries ordonnées suivant les puissances et les produits de ces petites quantités, en nous arrêtant partout aux parties du septième ordre de grandeur. Pour juger du degré de convergence de chacune de ces séries, on peut grouper ses différents termes de plusieurs manières, en réunissant chaque fois en un même groupe les termes qui ne diffèrent entre eux que par les puissances de l'une des cinq petites quantités ci-dessus et ordonnant les

diverses parties de chaque groupe suivant les puissances de cette petite quantité : chacun de ces groupes se présente alors sous forme d'une série simple dont la convergence est nettement accusée par la comparaison des valeurs numériques des différents termes qui le composent. Or, c'est lorsque l'on considère spécialement la petite quantité $\frac{n'}{n}$ pour la formation de ces divers groupes, c'est-à-dire lorsque chacun d'eux présente une série simple ordonnée suivant les puissances de $\frac{n'}{n}$, que la convergence de ces diverses séries partielles est le moins rapide. Cela indique naturellement que c'est sur les puissances de $\frac{n'}{n}$ que toute l'attention doit se porter pour compléter le coefficient d'une inégalité qui ne paraît pas déterminée avec une suffisante approximation ; c'est en cherchant un ou deux termes de plus, dans les plus importants de ces groupes ordonnés suivant les puissances de $\frac{n'}{n}$, qu'on parviendra à donner au coefficient tout entier de l'inégalité le degré d'approximation qui lui manque. C'est d'après ces considérations que les recherches suivantes ont été dirigées.

Les diverses parties d'un ordre analytique supérieur au septième, destinées à compléter les coefficients d'inégalités non suffisamment approchés, n'ont été cherchées que parmi les quantités indépendantes de γ , et contenant au plus la première puissance de $\frac{a}{a'}$ et la seconde puissance de e'. On n'a pas pu se restreindre de même à priori, relativement aux puissances de e qu'il convenait de conserver, parce que l'exposant dont cette quantité e est affectée tout d'abord subit une diminution progressive à mesure que le calcul des inégalités se développe : c'est ainsi que, si l'on prend dans la valeur primitive de R un terme contenant e' en facteur, et si l'on y substitue les formules de transformation fournies par les opérations 2, 3, 4, ce terme en produit successivement d'autres ayant en facteurs $e^3 \frac{n'^2}{n^2}$, $e^2 \frac{n'^8}{n^8}$, $e^2 \frac{n'^8}{n^8}$, $e^{n'^8} \frac{n'^8}{n^8}$; de sorte qu'un terme indépendant de e peut être la conséquence d'un terme en e³ pris dans la valeur primitive de R, et l'on n'aurait pas pu l'obtenir si ce terme en e⁴ avait été tout d'abord mis de côté. Toutefois on n'a conservé dans la valeur primitive de R que les puissances de e nécessaires pour arriver aux quantités que l'on avait spécialement en vue d'obtenir.

Les inégalités de la longitude dont les coefficients ont été ainsi complétés

chapitre x. — Recherches supplémentaires sur la longitude. 589 sont indiquées dans le tableau suivant, qui fait connaître pour chacune d'elles la forme littérale des diverses parties d'un ordre supérieur au septième, déterminées dans ces nouvelles recherches.

Pour arriver à déterminer ces compléments des huitième et neuvième ordres indiqués dans le tableau qui précède, nous avons dû reprendre la série de nos diverses opérations en les complétant elles-mêmes en vue des nouveaux résultats qu'elles devaient nous fournir. Il a fallu pour cela reprendre la valeur de la fonction perturbatrice R, telle qu'elle est donnée en détail au chapitre IV, et pousser plus loin le développement des coefficients d'un certain nombre de ses termes en vue d'obtenir le complément nécessaire pour les opérations auxquelles ces termes conduisent. Nous allons donner tout d'abord ces parties complémentaires de la fonction perturbatrice R. Nous indiquerons au-dessous du numéro de chaque terme l'ordre auquel nous nous sommes arrêté dans le calcul de son coefficient.

En effectuant les calculs nécessaires pour arriver aux nouveaux résultats que nous allons faire connaître, nous avons eu naturellement l'occasion de vérifier l'exactitude des calculs antérieurs. Nous avons ainsi reconnu dans nos premiers résultats, tels qu'ils sont donnés dans les chapitres précédents, l'existence de quelques inexactitudes qu'il est important de faire disparaître. Les formules qui suivent contiennent toutes les rectifications dont nous avons reconnu la nécessité. Elles donnent donc, outre les parties complémentaires que nous nous étions proposé de déterminer par ces nouveaux calculs : 1° les valeurs exactes des parties déjà obtenues qui ont besoin d'être rectifiées : elles sont marquées d'un (a); 2° les parties omises dans les premiers calculs : elles sont marquées d'un (b).

En reprenant successivement les diverses opérations que nous avons eu à effectuer pour faire disparaître de la fonction R les différents termes périodiques qu'elle renferme, et tenant compte des parties complémentaires que nous venons de faire connaître pour un certain nombre de ces termes périodiques, nous avons pu compléter les formules de transformation auxquelles ces opérations conduisent; nous avons cherché toutes les parties nouvelles de ces formules de transformation qui sont nécessaires pour obtenir les divers compléments des termes de la longitude qui sont indiqués ci-dessus (tableau des pages 589 et 590). Nous allons donner les résultats auxquels nous sommes ainsi parvenus. Ces résultats se rapportent généralement aux valeurs des seules quantités e, l, h + g + l; ce n'est qu'exceptionnellement que nous aurons à donner quelques parties complémentaires pour la valeur de a. Nous ferons connaître en même temps les parties complémentaires que nous avons dù introduire dans les valeurs de L et de G, parties qui sont toutes indépendantes de γ , e', $\frac{a}{a'}$.

En mettant complétement de côté les divers termes de R qui contiennent γ dans toutes leurs parties, nous avons pu nous contenter des deux quantités L, G sans nons préoccuper désormais de la quantité H, qui, jusqu'à présent, leur a toujours été jointe. Voici comment on peut s'en rendre compte : Remarquons d'abord que les arguments des seuls termes de R que nous avons à considérer contiennent tous g et h avec des coefficients égaux et de même signe ; de sorte que, si nous posons

 $h+g=g_1$

tous ces arguments, au lieu des variables h, g, l, renfermeront seulement g_+ et l. Posons encore

 $H = G + H_{\rm r}$

et à l'aide de ces deux relations qui définissent g_+ et H_+ , remplaçons les variables g_+ et H_+ . Soit K une fonction quelconque de l, g, h, L, G, H, dans laquelle nous faisons ce changement de variables. Désignons par $\left(\frac{dK}{dh}\right)$ et $\left(\frac{dK}{dG}\right)$ les dérivées partielles de K par rap-

chapitre x. — Recherches supplémentaires sur la longitude. 675 port à h et G, après la substitution des valeurs de g et H en g_+ et H_+ ; tandis que $\frac{dK}{dh}$, $\frac{dK}{dG}$ désignent les dérivées prises avant cette substitution. On aura

D'après cela, les six équations différentielles (9) du chapitre les seront remplacées par les suivantes, qui sont exactement de même forme :

$$\begin{split} \frac{d\,\mathbf{L}}{dt} &= \frac{d\,\mathbf{R}}{dl}, & \frac{d\,\mathbf{G}}{dt} &= \frac{d\,\mathbf{R}}{dg_1}, & \frac{d\,\mathbf{H}_{\mathrm{J}}}{dt} &= \left(\frac{d\,\mathbf{R}}{dh}\right), \\ \frac{dl}{dt} &= -\frac{d\,\mathbf{R}}{d\,\mathbf{L}}, & \frac{dg_1}{dt} &= -\left(\frac{d\,\mathbf{R}}{d\,\mathbf{G}}\right), & \frac{dh}{dt} &= -\frac{d\,\mathbf{R}}{d\,\mathbf{H}_{\mathrm{J}}}. \end{split}$$

Or, par suite de ce changement de variables, les divers arguments que nous avons à considérer dans les recherches actuelles sont tous indépendants de h; d'un autre côté, la considération de H_i ne peut introduire dans les formules que des termes en γ dont nous n'avons pas besoin : nous n'aurons donc à tenir compte que des quatre variables l, g_i , L, G, dans lesquelles nous devrons nous rappeler que g_i est mis pour h+g.

En faisant connaître, après chaque opération, les nouvelles valeurs de L, G, nous renverrons aux valeurs déjà données précédenment pour ces deux quantités, afin de n'avoir à écrire explicitement que les parties complémentaires qui doivent leur être ajoutées; mais, en se reportant à ces valeurs obtenues précédemment pour L, G, on devra y faire abstraction des parties contenant γ , e' ou $\frac{a}{a'}$. Les valeurs des dérivées partielles de a, e par rapport à L, G, après chaque opération, doivent être calculées de nouveau et complétement à l'aide des valeurs indiquées pour L, G; le changement de variables qui vient d'être effectué ne permet pas de se servir des valeurs données dans le chapitre V pour ces dérivées partielles, en leur ajoutant simplement des parties complémentaires d'ordres supérieurs à celui auquel on s'était arrêté.

OPÉRATIONS 22, 23, 24 et 25.

Dans les recherches supplémentaires dont nous nous occupons, nous laissons complétement de côté les quantités dépendant de γ . Nous devons donc également laisser de côté les opérations qui se rapportent aux termes de R contenant γ dans toutes leurs parties. Les opérations 22, 23, 24 et 25 sont dans ce cas. Cependant, par la manière dont ces quatre opérations ont été effectuées, elles ont introduit dans la valeur de la quantité (G) (chapitre V pages 490, 501, 514 et 527) et dans le terme (7) de la longitude (chapitre VII, pages 246 et 247) certaines parties indépendantes de γ . Pour ne pas avoir à nous préoccuper ici de cette anomalie que présentent les quatre opérations dont il s'agit, nous admettrons que, à la suite de ces quatre opérations, nous remplaçons partout

 $v = \text{par} \quad c = \frac{25}{4} e^{\zeta} \frac{n^{\prime i}}{n^i}$

ce qui fait disparaître complétement les parties indépendantes de γ dont nous venons de parler. Cette substitution peut se faire sans aucun inconvénient : ce n'est en réalité qu'une modification de l'une des constantes introduites par les dernières intégrations effectuées.

En reprenant, comme nous venons de le faire, la série des 497 opérations dont le détail est donné dans les chapitres Y et VI, pour compléter les formules de transformation fournies par un certain nombre d'entre elles, nous avons dù faire successivement la substitution des formules ainsi complétées dans la fonction perturbatrice R, conformément à ce qui est expliqué dans le chapitre III. La valeur finale de la fonction R, résultant de l'emploi successif des formules fournies par nos 497 opérations, ne contenait plus aucun terme périodique, lorsque nous nous bornions aux parties capables de donner des quantités d'un ordre au plus égal au septième dans les divers termes de la longitude; cette valeur finale de R se réduisait donc au seul terme non périodique

dont la valeur se trouve au chapitre VI, page 234. Mais il n'en est plus de même maintenant que nous voulons pousser l'approximation jusqu'aux quantités du huitième ou du neuvième ordre pour certaines inégalités de la longitude. La substitution des formules de transformation provenant des 497 opérations, dans les valeurs auxquelles se réduit successivement la fonction perturbatrice R, à mesure que ces opérations sont effectuées, laisse encore subsister dans cette fonction quelques termes périodiques qui nous mettent dans la nécessité de faire un certain nombre d'opérations supplémentaires destinées à les faire disparaître. De même, le terme non périodique de R contient quelques parties nouvelles d'un ordre supérieur à celui auquel nous nous étions arrêtés dans les chapitres V et VI. Le détail de ces parties nouvelles du terme non périodique de R, et des termes périodiques qui subsistent encore dans la valeur de cette fonction après que les 497 opérations ont été effectuées, est donné ci-dessus, pages 591 à 673. En y faisant la réduction des parties semblables, on trouve que, à la suite des 497 opérations, la valeur de R devient :

R = partie non périodique donnée au chapitre VI (page 234)

$$\begin{array}{c} (1) \\ + m' \frac{a^2}{a'^3} \Big\} - \frac{5603531}{49152} e^t \frac{n'^4}{n^8} + \frac{15199270319}{4718592} e^t \frac{n'^5}{n^9} - \frac{1480597589}{2359296} e^2 \frac{n'^6}{n'^9} \\ - \left(\frac{436141399}{663552} (a) + \frac{40637787076301}{1358954496} e^2 \right) \frac{n''}{n^7} \Big\} \\ (2) \\ + m' \frac{a^2}{a'^3} \Big\} - \left(\frac{5589}{1024} e^t + \frac{479655}{2048} e^2 e^t \right) \frac{n'^6}{n^8} - \frac{20007}{512} e^t \frac{n'^7}{n^7} \Big\} \cos t' \\ (3) \\ + m' \frac{a^2}{a'^3} \Big\} - \frac{1071}{32} e^2 e^{t2} \frac{n'^6}{n^8} \Big\} \cos t' \\ (8) \\ + m' \frac{a^2}{a'^3} \Big\} - \frac{146523}{2048} e^t \frac{n'^6}{n^8} \Big\} \cos (t - t') \\ (12) \\ + m' \frac{a^2}{a'^5} \Big\} - \frac{315555}{2048} e^t \frac{n'^6}{n^8} \Big\} \cos (t + t') \\ (76) \\ + m' \frac{a^2}{a'^5} \frac{3213}{512} e^2 \frac{n'^6}{n^9} \cos (2h + 2g + 2t - 2h' - 2g' - 2t') \\ \end{array}$$

Pour faire disparaître de cette valeur de R les neuf termes périodiques qu'elle contient encore, nous effectuerons les huit nouvelles opérations suivantes, nous contentant, pour chacune d'elles, d'écrire les seules formules de transformation qui puissent nous être utiles.

Ces huit opérations supplémentaires étant effectuées, la valeur de la fonction R ne contient plus aucun terme périodique; elle se trouve donc réduite à son terme non périodique seul, terme dont la valeur a été indiquée ci-dessus (page 742). D'ailleurs les quantités L, G ont les valeurs qui ont été indiquées à l'occasion de la 286° opération (page 733). A l'aide de ces valeurs complétées du terme non périodique de R et des deux quantités L, G, on peut calculer les termes complémentaires qui en résultent pour les expressions de $\frac{dl}{dt}$ et $\frac{d(h+g+l)}{dt}$, fournies par les relations données au chapitre VI (pages 237 et 238). On trouve ainsi :

 $\frac{dl}{dt}$ = valeur donnée au chapitre VI (page 237)

$$+ n \left\{ -\frac{8423971}{16384} e^2 \frac{n'^6}{n^6} - \frac{11815934871}{1179648} e^2 \frac{n'^7}{n^7} - \frac{78733666309}{7077888} \frac{n'^8}{n^8} - \frac{1348130735399}{25165824} \frac{n'^9}{n^8} \right\};$$
T. XXIX.

 $\frac{d(h+g+l)}{dt}$ = valeur qui se déduit des formules données au chapitre VI (pages 237 et 238)

$$+n\left\{-\frac{3908803}{2048}e^2\frac{n'^6}{n^6}+\frac{269323645}{442368}\frac{n'^8}{n^8}\right\}.$$

A l'aide des diverses formules qui viennent d'être établies, on a obtenu les parties complémentaires suivantes pour les termes de la longitude V indiqués ci-dessus, au tableau des pages 589 et 590 :

V = Partie donnée au chapitre VII (pages 241 à 243)

CHAPITRE XI.

VALEURS RÉDUITES DES TROIS COORDONNÉES DE LA LUNE.

Après avoir donné en détail, dans les chapitres VII, VIII, IX et X, les différentes parties que nous avons été conduits à introduire dans les expressions des trois coordonnées de la Lune, îl ne nous reste plus qu'à effectuer la réduction des termes semblables dans les coefficients des diverses inégalités dont ces expressions se composent. La réduction étant effectuée, chacun de ces coefficients sera une fonction des quantités a, e, γ, a', e' ; car on ne doit pas oublier que n et n' sont mis pour $\frac{\sqrt{\mu}}{a\sqrt{a}}$, $\frac{\sqrt{m'}}{a'\sqrt{a'}}$.

Les trois lettres a, e, \gamma avaient une signification entièrement déterminée dans les formules du mouvement elliptique qui nous ont servi de point de départ; elles représentaient respectivement le demi-grand axe de l'orbite de la Lune, l'excentricité de cette orbite et le sinus de la moitié de l'inclinaison de son plan sur le plan de l'écliptique. Mais il n'en est plus de même dans les expressions complexes que nous avons obtenues pour les coordonnées de la Lune à l'aide de la série des opérations développées précédemment; les lettres α , e, γ ne sont plus que des constantes arbitraires introduites dans ces expressions à la suite de toutes les intégrations que nous avons du effectuer. La manière dont ces constantes arbitraires ont été introduites dépend essentiellement de la marche qui a été suivie dans la recherche des inégalités; aussi, bien que le résultat final du calcul des inégalités doive être exactement le même, quel que soit le mode adopté pour y arriver, trouve-t-on pour les expressions de leurs coefficients des fonctions différentes des lettres représentant les constantes, en raison de la diversité des méthodes suivies. Pour donner aux lettres a, e, γ une signification absolue et bien précise qui ne dépende nullement du

mode d'intégration employé, nous ferons dans nos formules réduites une dernière transformation destinée à ramener :

1° Le coefficient de sin*l*, dans le terme (7) de la longitude (premier terme de l'équation du centre), à avoir le même coefficient

$$rc = \frac{1}{4}c \pm \frac{5}{96}c$$

que dans les formules du mouvement elliptique;

2° Le coefficient de $\sin(g+l)$, dans le terme (1) de la latitude, à avoir également le même coefficient

$$2\gamma - 2\gamma e^2 + \frac{1}{4}\gamma^5 + \frac{7}{32}\gamma e^4 + \frac{1}{4}\gamma^5 e^2 - \frac{5}{144}\gamma e$$

que dans les formules du mouvement elliptique;

3° Enfin, le coefficient du temps t, dans l'expression de la longitude moyenne h+g+l, à avoir de même pour valeur

$$n = \text{ou} = \frac{\sqrt{2}}{a\sqrt{a}}$$

Toute réduction faite dans le coefficient du terme (7) de la longitude, tel qu'il est donné dans les chapitres VII (pages 245 à 249) et X (pages 750 et 751), on trouve pour ce coefficient l'expression suivante :

$$\begin{split} &\lambda e^{-\frac{1}{4}}e^{-\frac{45}{4}}\gamma^{2}e^{+\frac{5}{2}}\gamma^{2}e^{3} + \frac{5}{96}e^{3} + 75\gamma^{2}e^{+\frac{1585}{10}}\gamma^{2}e^{2} + \frac{65}{24}\gamma^{2}e^{2} + \left(\frac{255}{4}\gamma^{2}e^{-\frac{615}{64}}\gamma^{2}e^{-\right)\frac{n}{n}} \\ &\left(\frac{81}{64}e^{-\frac{67}{8}}\gamma^{2}e^{+\frac{2485}{512}}e^{3} + \frac{991}{64}e^{e^{2}} + \frac{115985}{512}\gamma^{2}e^{-\frac{20727}{512}}\gamma^{2}e^{-177\gamma^{2}e^{e^{2}} + \frac{3237}{4096}e^{-\frac{8831}{512}}e^{-e^{2}}\right)\frac{n^{e^{2}}}{n^{2}} \\ &+ \left(\frac{2595}{128}e^{+\frac{129}{64}}\gamma^{2}e^{-\frac{126105}{1024}}e^{3} - \frac{21645}{256}e^{e^{2}} + \frac{656985}{8192}e^{5}\right)\frac{n^{e}}{n^{2}} \\ &+ \left(\frac{195691}{16384}e^{+\frac{174201}{1024}}\gamma^{2}e^{-\frac{48886327}{131072}}e^{3} - \frac{7302099}{8192}e^{e^{2}}\right)\frac{n^{e}}{n^{3}} \\ &- \left(\frac{2986255}{49152}e^{+\frac{854220197}{393216}}e^{3}\right)\frac{n^{e^{2}}}{n^{5}} - \frac{11416235965}{18874368}e^{\frac{n^{e}}{n^{6}}} - \frac{202872887675}{37748736}e^{\frac{n^{e}}{n^{2}}} - \frac{75}{39}ee^{\frac{1}{4}}\cdot\frac{n^{2}}{n^{2}} - \frac{405}{64}e^{\frac{n^{2}}{n^{2}}}\cdot\frac{n^{2}}{n^{2}}. \end{split}$$

CHAPITRE XI. — VALEURS RÉDUITES DES COORDONNÉES DE LA LUNE. 799 De même, le coefficient du terme (1) de la latitude, tel qu'il est donné dans le chapitre VIII (pages 415 à 418), devient, après réduction des parties semblables,

$$\begin{split} &2\gamma - 2\gamma e^{i} - \frac{1}{4}\gamma^{5} - \frac{5}{4}\gamma^{5}e^{i} - \frac{1}{64}\gamma e^{i} - \frac{3}{8}\gamma^{i}e^{i} + \frac{85}{64}\gamma^{i}e^{i} + \frac{35}{72}\gamma e^{i} + \left(\frac{195}{64}\gamma^{i}e^{i} + \frac{615}{256}\gamma e^{i}\right)\frac{n^{i}}{n^{i}} \\ &- \left(\frac{57}{64}\gamma - \frac{293}{64}\gamma^{3} + \frac{553}{128}\gamma e^{i} + \frac{163}{64}\gamma e^{i2} + \frac{1619}{512}\gamma^{5} - \frac{1757}{32}\gamma^{3}e^{i} - \frac{873}{64}\gamma^{2}e^{i2} + \frac{68041}{8192}\gamma e^{i} + \frac{685}{128}\gamma e^{i}e^{i}\right)\frac{n^{i}}{n^{i}} \\ &+ \left(\frac{129}{128}\gamma - \frac{777}{128}\gamma^{i} - \frac{25503}{256}\gamma e^{i} + \frac{701}{256}\gamma e^{i}\right)\frac{n^{i}}{n^{3}} - \left(\frac{229}{16384}\gamma - \frac{105345}{8192}\gamma^{i} + \frac{3210795}{8192}\gamma e^{i} - \frac{209085}{8192}\gamma e^{i}\right)\frac{n^{i}}{n^{i}} \\ &- \frac{36203}{16384}\gamma \frac{n^{i5}}{n^{5}} - \frac{302262229}{18874368}\gamma \frac{n^{i6}}{n^{6}} - \frac{25}{8}\gamma e^{i} \cdot \frac{a^{2}}{a^{2}} - \frac{945}{256}\gamma \frac{n^{i2}}{n^{i}} \cdot \frac{a^{2}}{a^{i}}. \end{split}$$

Enfin, d'après les formules données à la fin du chapitre VI (pages 237 et 238), le coefficient du temps t, dans l'expression de la longitude moyenne h+g+l, a pour valeur

CHAPITRE XI. - VALEURS RÉDUITES DES COORDONNÉES DE LA LUNE. 801

Après avoir fait subir aux coefficients des diverses inégalités les modifications qui viennent d'être indiquées, nous mettrons partout la lettre m à la place du rapport $\frac{n'}{n}$. Nous remplacerons aussi dans les arguments des diverses inégalités h+g+l-h'-g'-l' par D et g+l par F; de sorte que ces arguments se trouveront exprimés à l'aide des quatre lettres D, F, l, l' qui représentent respectivement :

D, la distance movenne de la Lune au Soleil;

F, la distance moyenne de la Lune au nœud ascendant de son orbite;

l, l'anomalie moyenne de la Lune;

l', l'anomalie moyenne du Soleil.

Enfin, pour mettre complétement en évidence l'importance de chacun des termes obtenus dans les coefficients des diverses inégalités, et le degré d'approximation avec lequel ces coefficients se trouvent déterminés, nous écrirons au-dessous de chacun de ces termes partiels sa valeur numérique réduite en secondes de degré. Pour cela, nous partirons des données suivantes :

Les durées des révolutions sidérales de la Lune et de la Terre étant respectivement de 27^{i} , 321661 et 365^{i} , 25637, le rapport de ces deux nombres donne immédiatement le rapport $\frac{n'}{n}$ ou m de leurs moyens mouvements; de sorte qu'on a

m = 0.07480133.

L'excentricité e' de l'orbite de la Terre a pour valeur (Annales de l'Observatoire impérial de Paris, tome IV, page 102)

e' = 0.01677106.

M. Airy, dans son Mémoire intitulé : Corrections of the Elements of the Moon's orbit, etc. (Mémoires de la Société royale Astronomique de Londres, vol. XXIX), a fixé la valeur du coefficient du premier terme de l'équation du centre de la Lame à 22639″,06. En égalant ce nombre à la quantité

$$2e - \frac{1}{4}e^3 + \frac{5}{96}e^5$$

T. XXIX.

qui est l'expression analytique du même coefficient dans nos formules réduites, on trouve pour e la valeur

$$e = 0.05489930$$

Dans le même Mémoire, M. Airy a fixé à 18535",55 la valeur du coefficient du terme principal de la latitude de la Lune, cette latitude étant exprimée en fonction de la longitude vraie de la Lune, au lieu de l'être en fonction de la longitude movenne, ou du temps, comme dans nos formules. Mais si l'on calcule, à l'aide des formules de Plana (Théorie du mouvement de la Lune, tome 1°, pages 496 et 704 *), la correction qu'il faut apporter à ce coefficient pour avoir le coefficient du terme principal de la latitude exprimée en fonction du temps, on trouve que ce dernier coefficient a pour valeur 18461", 26. En égalant ce nombre à notre expression analytique

$$2\gamma - 2\gamma e^2 - \frac{1}{4}\gamma^5 + \frac{7}{32}\gamma e^4 + \frac{1}{4}\gamma^5 e^7 - \frac{5}{144}\gamma e^6$$

du même coefficient, et tenant compte de la valeur de c donnée ci-dessus, on trouve

$$\gamma = 0.04488663$$

La constante de la parallaxe équatoriale de la Lune a été fixée récemment par M. Breen à 3422″,7 à l'aide d'observations faites simultanément en Europe et au Cap de Bonne-Espérance. D'ailleurs, si l'on prend le rayon de l'équateur de la Terre pour unité, on a, d'après nos formules réduites,

$$\frac{1}{a} \left[1 + \left(\frac{1}{6} + \frac{1}{4} e^2 \right) m - \frac{179}{88} m \right] = \frac{97}{18} m$$

pour l'expression de cette constante. Il en résulte pour a la valeur

$$a = 60,31854.$$

^{*} On doit tenir compte, dans la formule donnée par Plana, à la page 704, des corrections indiquées par M. Adams (voyez les Comptes rendus de l'Académie, tome LIV, page 876).

CHAPITRE XI. — VALEUR RÉDUITE DE LA LONGITUDE DE LA LUNE. 803 En adoptant 8",75 pour la valeur de la constante de la parallaxe équatoriale du Soleil, constante qui, à l'aide de nos notations, est exprimée par $\frac{1}{a'}$, et remarquant que, d'après la valeur adoptée ci-dessus pour la parallaxe équatoriale de la Lune, $\frac{1}{a}$, exprimé en secondes, a pour valeur

on en déduit

$$\frac{a}{a'} = 0.00255878$$

Cela posé, nous aurons pour la longitude de la Lune l'expression suivante :

$$V = nt + 2$$

$$+ \left(\frac{3 e' - \frac{27}{2} \gamma^2 e' + \frac{27}{8} e^2 e' + \frac{27}{8} e'^{15} + 9 \gamma^4 e' - \frac{45}{4} \gamma^2 e^2 e' - \frac{243}{16} \gamma^2 e'^{15} + \frac{9}{32} e^4 e' - \frac{243}{64} e'^{15} + \frac{9}{32} e^4 e' - \frac{243}{64} e'^{15} + \frac{9}{32} e^4 e' - \frac{243}{64} e'^{15} + \frac{261}{64} e'^{15} \right) m$$

T. XXIX.

Nous aurons enfin pour la parallaxe équatoriale P de la Lune, égale à $\frac{1}{r}$ *, si l'on prend pour unité le rayon de l'équateur de la Terre, l'expression :

$$P = \frac{1}{a} \left(1 + \left(\frac{1}{6} + \frac{1}{3} e^2 \right) m^2 - \frac{179}{288} m^4 - \frac{97}{48} m^5 \right)$$

(3)
$$-\frac{1}{n} \cdot \frac{9}{4} e^{i2} m^2 \cdot \cos 2 l'$$

$$\begin{pmatrix} c - \frac{1}{8}e^3 + \frac{5}{2}\gamma^4e - \frac{5}{4}\gamma^2e^3 + \frac{1}{192}e^5 - \left(\frac{7}{12}e - \frac{19}{32}\gamma^2e - \frac{19}{96}e^7 + \frac{7}{8}ee^{t^2}\right)m^2 + \frac{285}{64}em^3 \\ + \frac{1}{6} \\ - \frac{45091}{2504}em^4 \\ - \frac{45091}{2504}em^4 \end{pmatrix}$$

 $\times \cos t$

$$+\frac{1}{a}\left(\frac{63}{52}ee^{i2}m + \frac{4635}{256}ee^{i2}m^2\right)\cos(l - 2l')$$

^{*} Pour parler rizoureusement, nous devrions dire que $\frac{1}{r}$ est égal a sin P, et non pas à P. Dans le cas de la Lune, la parallaxe diffère de son sinus d'une quantité qui n'est pas négligeable. Mais la diffèrence ne portant d'une manière sensible que sur les parties constantes des expressions de P et de sin P, il nous suffit d'attribuer à la partie constante de sin P ou $\frac{1}{r}$ la valeur que les observations ont fournie pour la constante de la parallaxe P; et des lors, nous pouvons regarder P comme égal à $\frac{1}{r}$.

APPENDICE AU CHAPITRE X.

Outre les termes de la Longitude de la Lune qui sont indiqués dans le chapitre X (pages 589 et 590) comme ayant été l'objet de recherches supplémentaires destinées à pousser plus loin les approximations, on a encore complété de la même manière les termes suivants :

NUMÉROS des inégalités.	ARGUNENTS.	NOUVELLES PARTIES DÉTERMINÉES.
253	4h + 4g + 3l - 4h' - 4g' - 4l'	$e^3 \frac{n'^5}{n^5}, \qquad e^2 \frac{n'^7}{n^7},$
254	4h + 4g + 3l - 4h' - 4g' - 5l'	$e^{i}e^{i}rac{n^{t_0}}{n^6}$,
258	4h + 4g + 2l + 4h' - 4g' - 4l'	$e^2 \frac{n^{\prime u}}{n^{u}}$,
259	4h + 4g + 2l - 4h' - 4g' - 5l'	$e^2e'\frac{n'^5}{n^5}$.

Pour cela, il a fallu d'abord compléter les deux termes (215) et (216) de R. On a trouvé pour ces deux termes :

$$\begin{array}{c} \text{(215)} \\ +m'\frac{a^2}{a'^3} \end{array} = \begin{array}{c} \text{Parties données au chapitre IV (pages 200 et 201) et au chapitre X (page 649)} \\ +m'\frac{a^2}{a'^3} \end{array} \\ -\frac{495}{256}e^s\frac{n'^3}{n'} + \frac{4521}{1024}e^2\frac{n'^5}{n^5} - \frac{63}{512}e^t\frac{n'^3}{n^3} - \frac{675}{512}e^t\frac{n'^3}{n^5} + \frac{58995}{1024}e^2\frac{n'^5}{n^5} \\ \times \cos(4h + 4g + 4l - 4h' - 4g' - 4l'), \end{array}$$

THÉORIE DU MOUVEMENT DE LA LUNE.
